

**CALIFORNIA STATE SCIENCE FAIR
2002 PROJECT SUMMARY**

Name(s) Rhett T. Williams	Project Number S0717
Project Title How Antenna Design Affects Signal Strength	
<p style="text-align: center;">Abstract</p> <p>Objectives/Goals I hope to find a better antenna design. that will improve my access points range in one direction.</p> <p>Methods/Materials I will be testing five different antenna designs made out of copper and fiberglass. I will be testing them at one fixed location for both end points and at a set distance away from the access point. I will be using a control antenna as a baseline to help determine the best design. For measuring the test I will be using WildPackets Airopoek and Cisco Link status. I will hook all of the antennas up individually to the access point to see if the signal strength has changed and I will be in a fixed position away from the access point.</p> <p>Results I found on my experiment that all of my designs preformed differently than I thought they would. The design that I was favoring to do the best did perform the best. But I found some problems in the dipole design so I fixed them and now the antenna has optimum performance. It also improved since the first time I used it and now that I fixed the problems in the antenna if has a greater gain than before. Now for the other antenna designs, they were good but not as good as the dipole design. I found with the other antenna designs I developed better ways of building them now after my experiments are complete. The antenna designs I thought would do better didn#t do as good as the ones I thought that would not do as good. I found some new ways to make antennas and how to position them. I feel with a better antenna design it will further the distance you can expect to be away from the access point. With this knowledge I can think outside the box and develop antenna designs that allow you to go further that just the 150 feet these radios are capable.</p> <p>Conclusions/Discussion Now for the other antenna designs, they were good but not as good as the dipole design. I found with the other antenna designs I developed better ways of building them now after my experiments are complete. The antenna designs I thought would do better didn#t do as good as the ones I thought that would not do as good. I found some new ways to make antennas and how to position them. I feel with a better antenna design it will further the distance you can expect to be away from the access point. With this knowledge I can think outside the box and develop antenna designs that allow you to go further that just the 150 feet these radios are capable.</p>	
Summary Statement I plan on finding a better antenna design.
